Question 12

Main part of a skateboard

Select one:

- a. Tail
- b. Truck
- c. Nose
- d. Deck

The quality of the graphics output on a computer printer is measured in dpi (dots per inch). Simply by changing the density of dots that make up each part of an image, the printer can produce graphics that look almost photographic. To understand how this works, consider how a black-and-white photograph shows the shades which, in real life are colors. Each color is different shade of gray. For graphics to be produced on the computer printer, a piece of software called a printer driver decides upon a dot pattern which will represent each color shade. These different patterns or textures each create an individual effect which your eye translates into grey shades. The closer you look at the image, however the less lifelike it looks.

Question 13

According to the passage, a computer printer can

Select one:

- a. Produce pictures
- b. Look photographs
- c. Change photographs
- d. Measure dot per inch

Question 14

In line 3, the word "this" refers to
